

# Safe & Sustainable Drainage for the Healthcare Sector

Hospitals are complex with diverse functions such as medical units, emergency services, food & beverage manufacturing and housekeeping

Every aspect of drainage must be considered from initial design and installation through to cleaning and maintenance

In sensitive environments, it is necessary to create a zero-risk environment

**SAFE AND RELIABLE DRAINAGE CAN:**

Be specifically engineered for hygiene-sensitive services like food manufacturing

Help reduce the spread of infectious diseases by disposing of contaminated wastewater effectively

Reduce the risk of contaminating surrounding groundwater due to improper wastewater management

Optimise cleanliness by reducing chances of cross-contamination

Eliminate the leak of toxic gases and unpleasant odours that cause harmful diseases

Minimise operational costs as they require less maintenance
